

Design Rule for This land of ours: Yilin

Text description

Players are a male moose, Today is the last day of the breeding season. tomorrow players will leave the deer herd and return to a solitary state.

Player needs to collect eatable foods in environment based on his wife and child's expectation for the last dinner together.

Theme:

bitter sweet farewell,

Related Emotion:

sadness, curious, lively, hope.

natrual tones and some warm highlights.

tundra climate plant

Art style:

Color

natrual tones and some warm highlights.

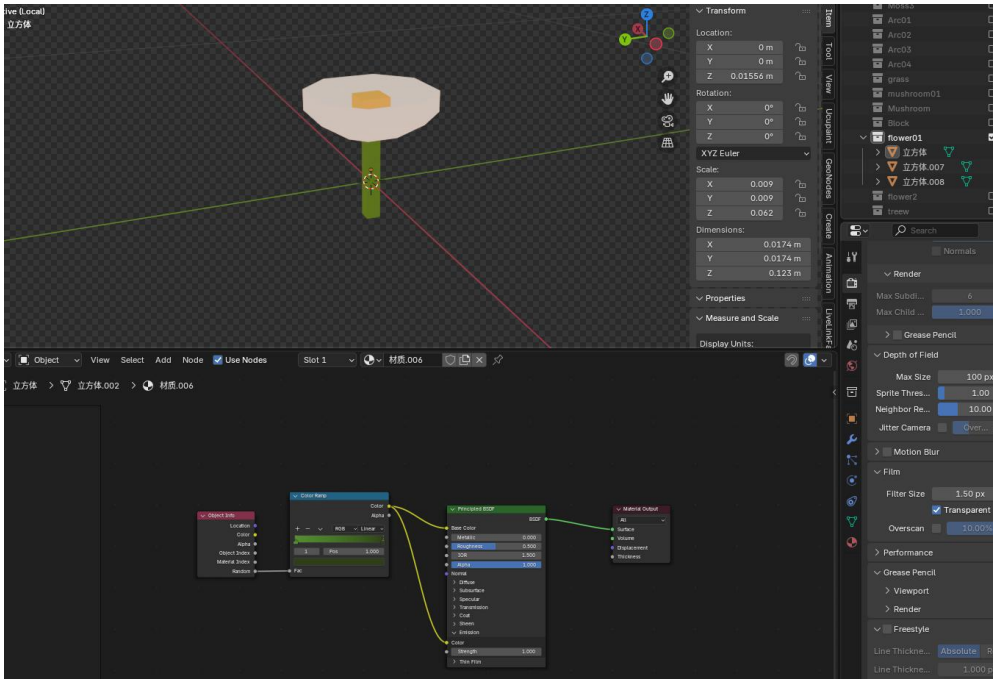

Overall high saturation But control brightness in a firm range.

Modelling& Distribution

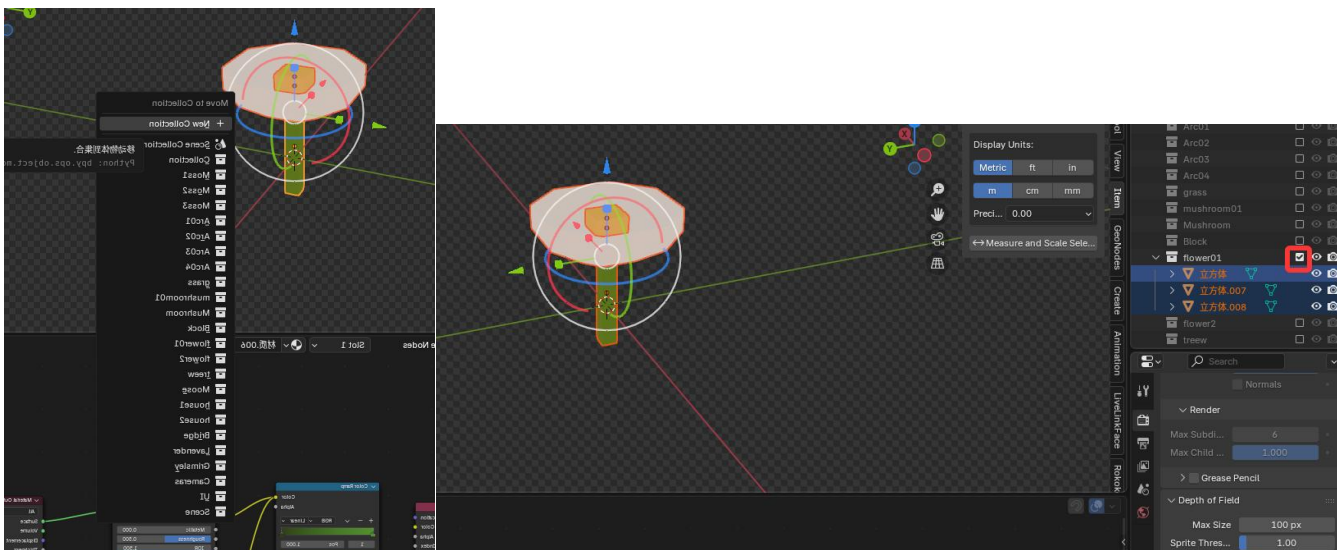

All models are box with different size (expect moose and tree.)

Step by Step to create scattered plant:

Step one: create plant

Create plant and set material for each part of plant,then use **M** to pack them in a group:

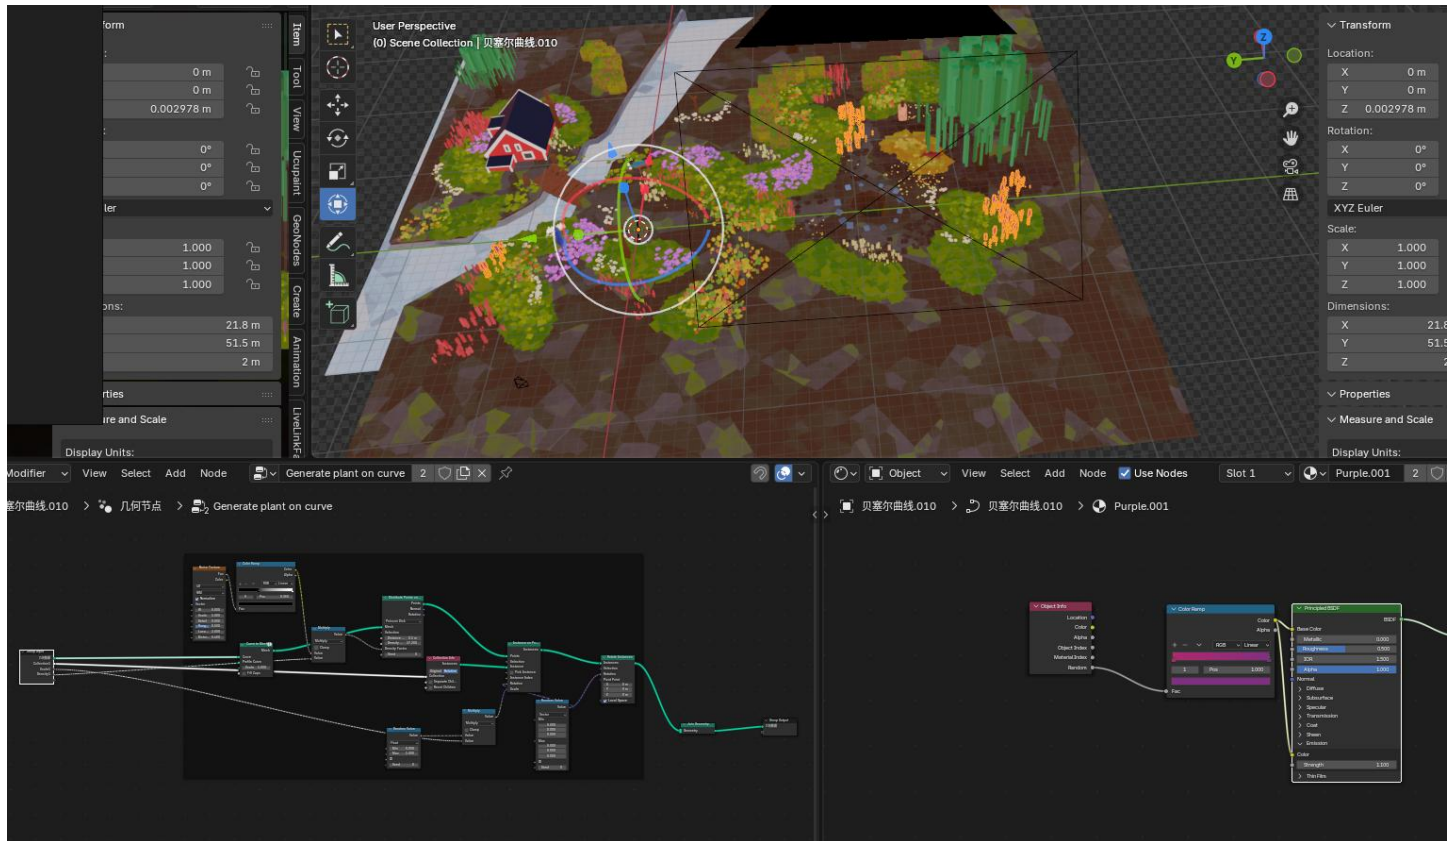

Each plant should have a separate group. then click the small check to disable it in the scene.

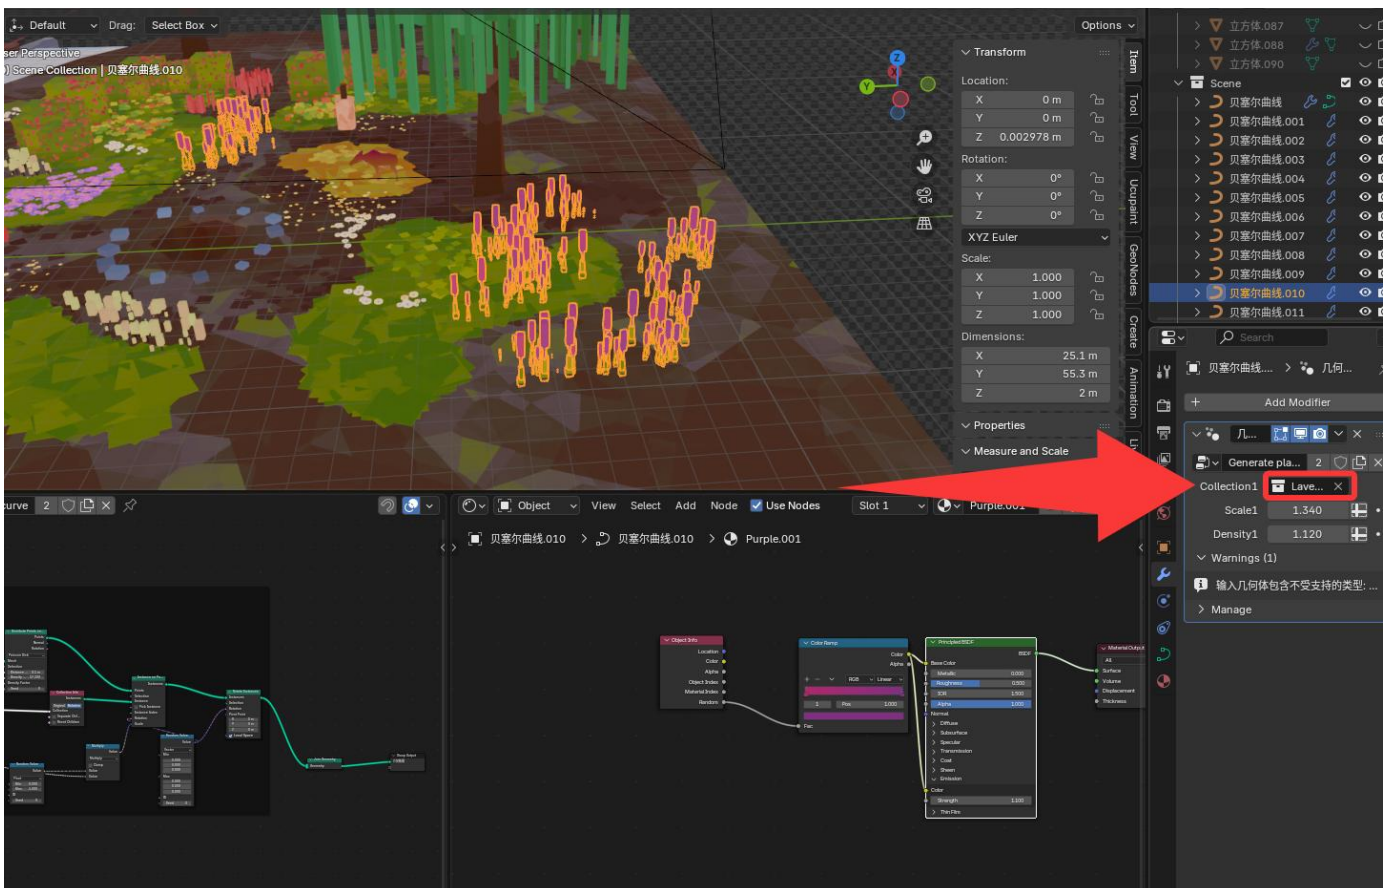

Step 2 curve

Duplicate a existing plant curve on the scene or create a Bezier curve, and apply geomeny node” generate plant on curve”

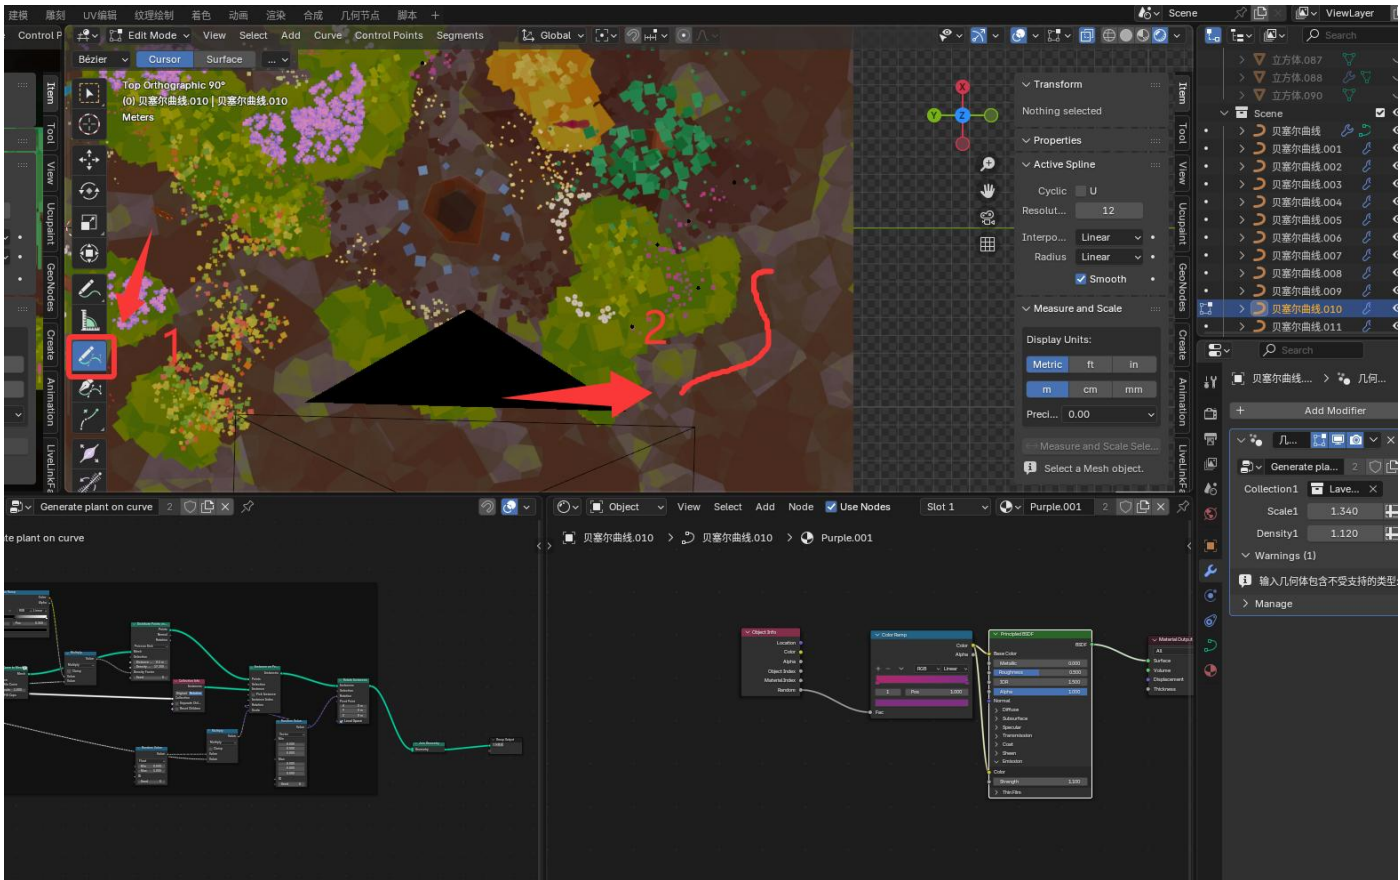

- If you duplicate existing curve, inside Edit mode, press "a" to select and "delete" to delete all the existing curves

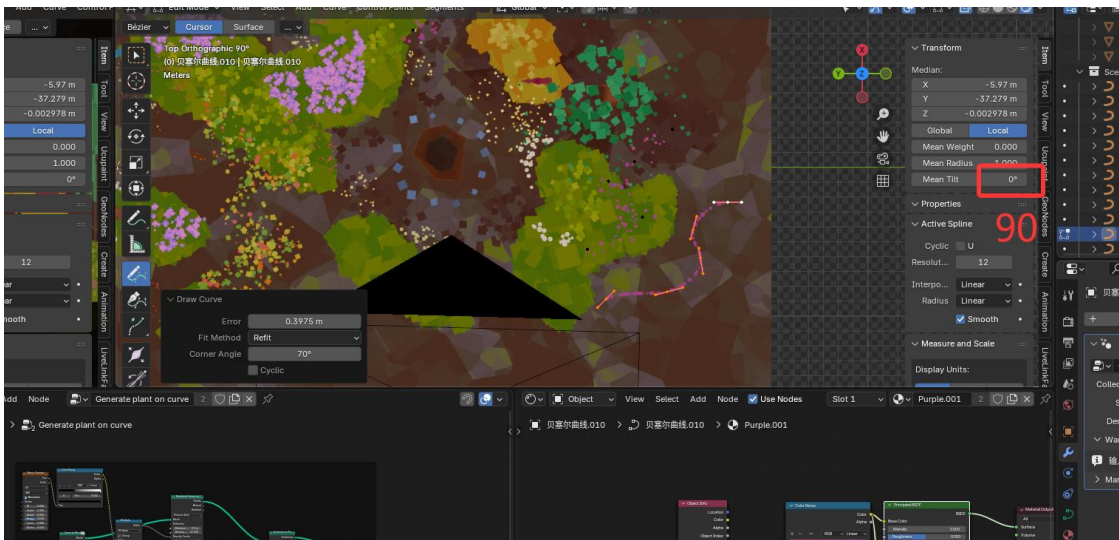

Go to modifiers, change the collection to your plant. You can adjust scale and density later.

Go to **edit mode** and draw a curve (better in top- down view)

Change Mean tilt to 90

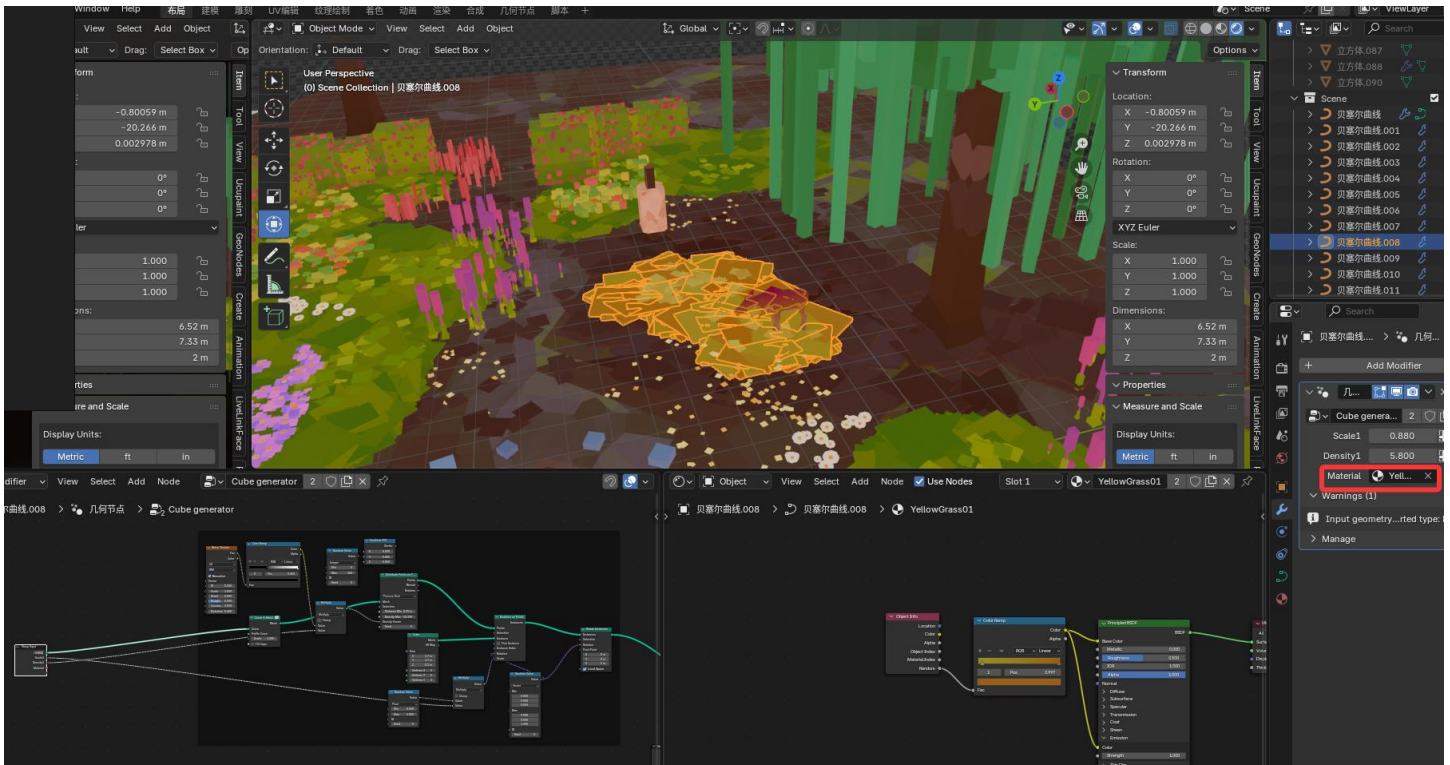

Adjust size and density until you feels right

Finished!

Most of the plant in this map are created in this way.

Cube generator

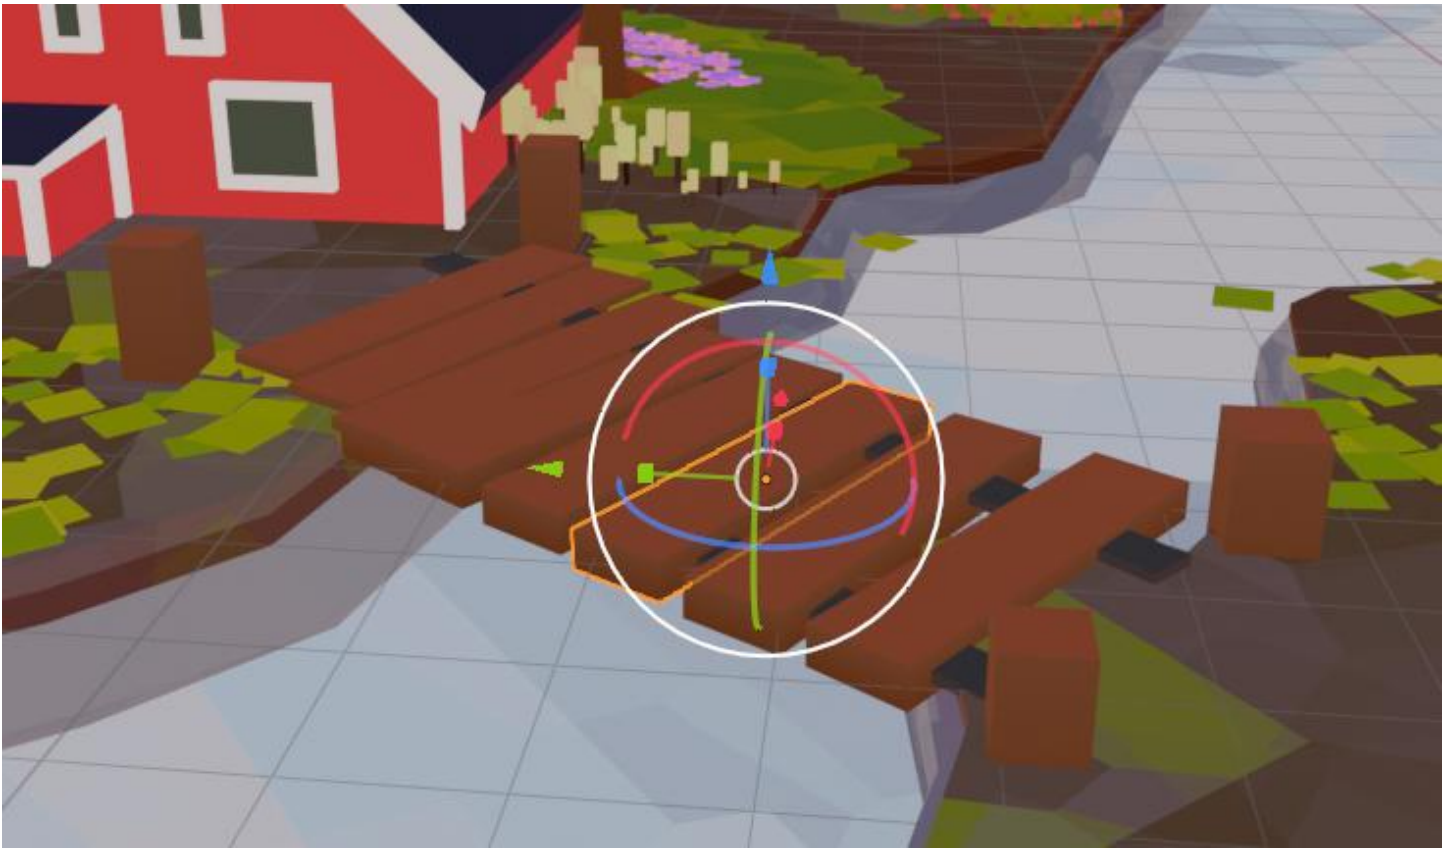

Some of the quick model like grass(simple cubes) are create in a similar but more easy way.

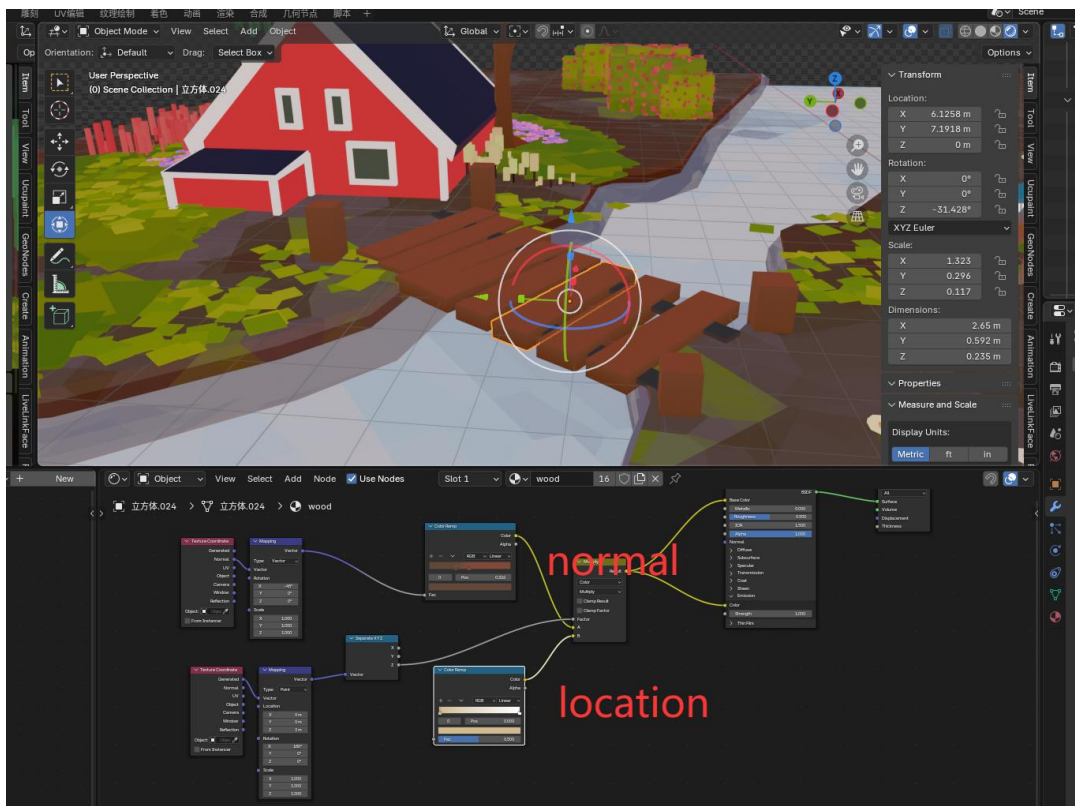

Create or use curve in a similar way, and adjust material here instead of select new collections.

Tree/wood/Light effected object

This is the part where you want to have some item that has a fake light like this

Use wood texture,

Adjust the color ramp on the top side to change color on the top/ other side of the model

Adjust the bottom colorramp to change additional color you would like to have on different height of the model.

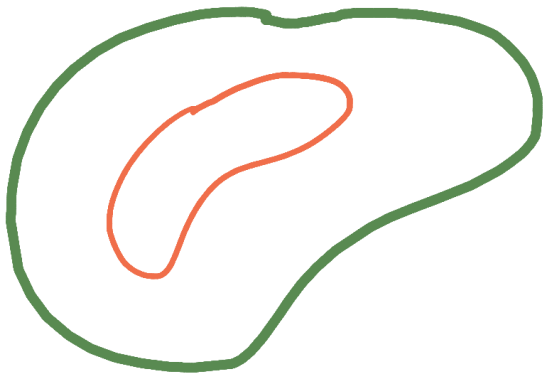

Trees, houses and briges are created manually on the map instead of generated.

Distribution logic of vegetation

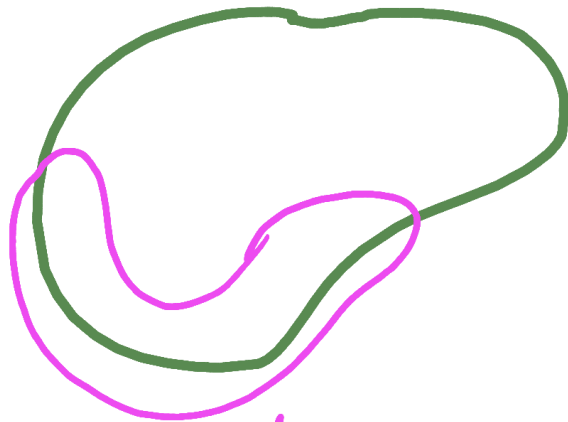

In most times we use grass to set base distribution and put other vegetation around in ways:

①

inner

②

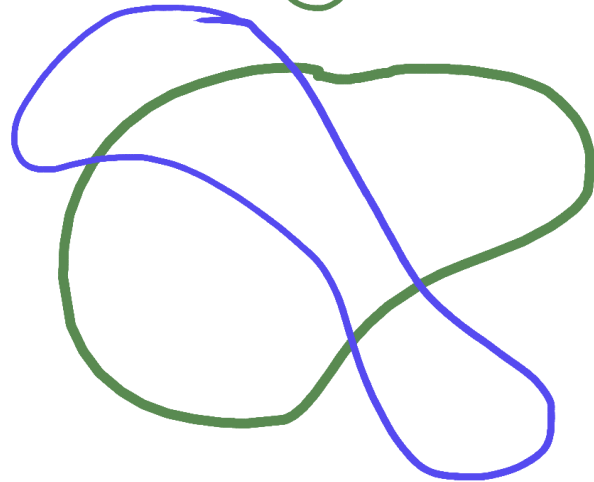

side

③

with

④

pass

Usually one block of grass will have 2-5 block of plant near by in these relations.

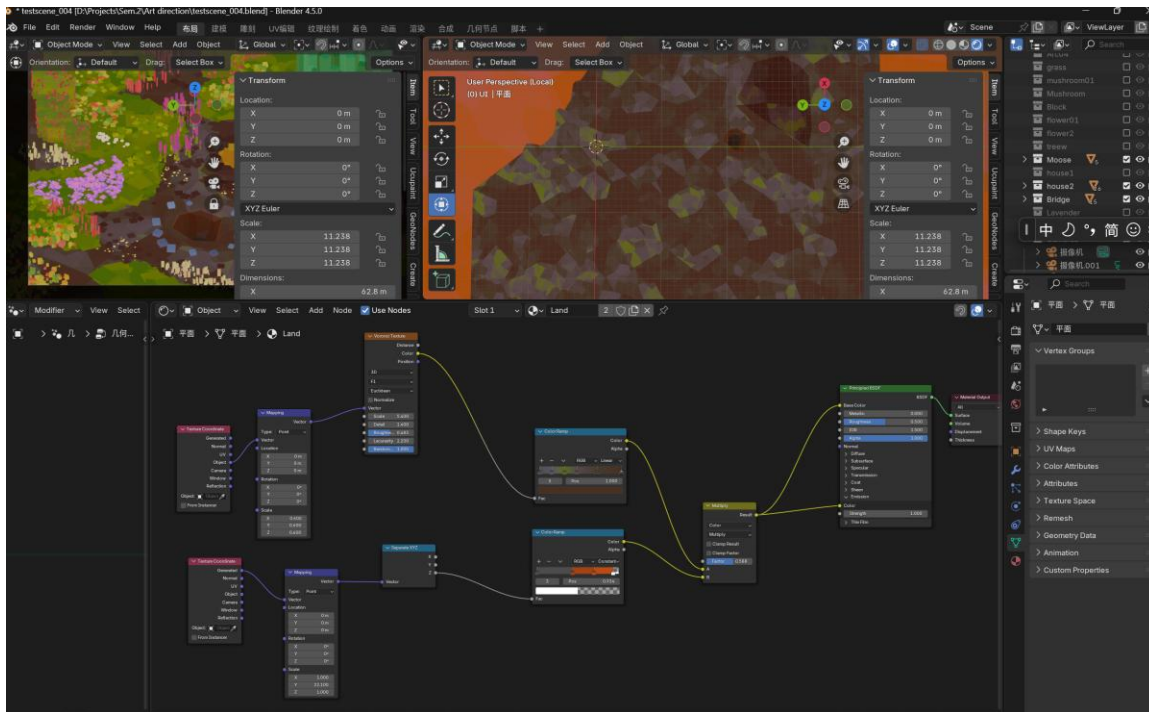

Overall scene distribution

The items in the scene are distributed in circles that are not fully connected around the key items.

Natural textures: Using ground texture as an example

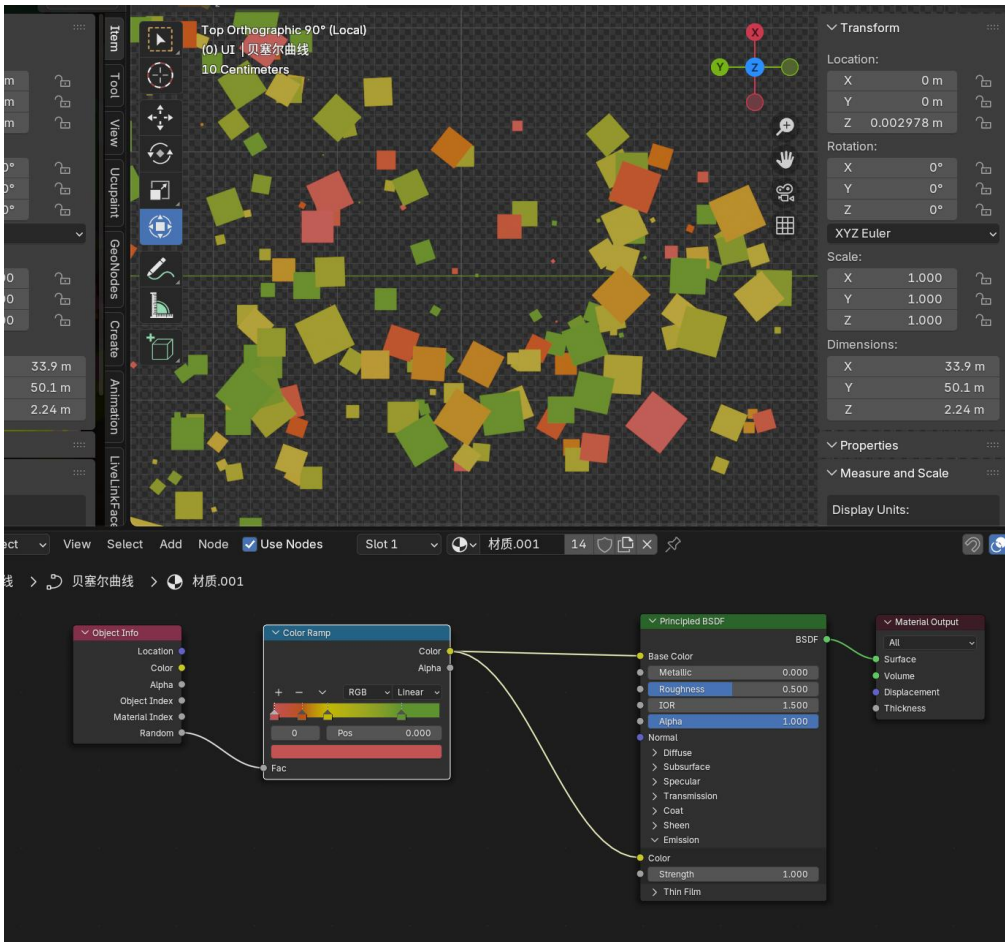

Description: Voronoi texture with Colorramp as random geometry style noise. And use another gradient to control color by depth.

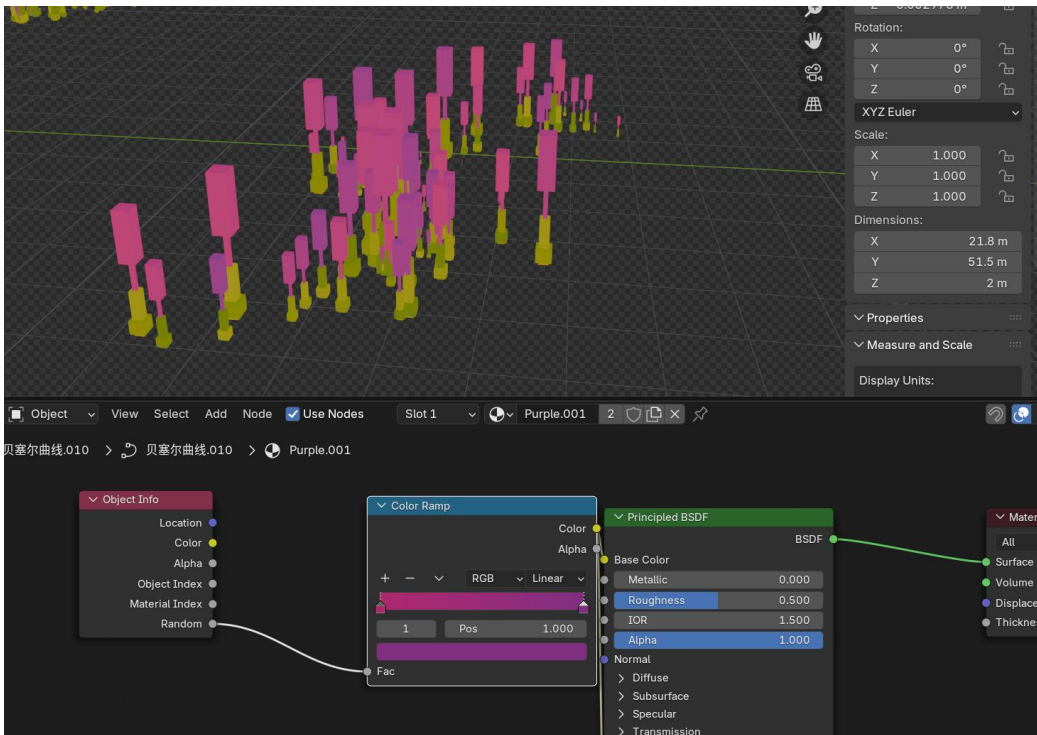

Using “land ” material to use this texture.

Natural color: Vegetation

Using Random Object info as fac to generate random color on a color ramp for **base color and emission(Image later)**

Also for flowers with similar color gradients.

Your task !

Currently we have two scene for the game, human living area and moose living area, they are separately represented two tasks for players: cook dinner, and exchange food.

Your task is to design a forest area, which is the next task for players.

Player(the smallest moose) need to search mushrooms and berries inside forest, where there will be human hunting them. So they have to be extra careful.(no actual human model inside scene, just bullets)

There is not a lot of colorful flowers inside the forest, but small moss and lichen still add a bit shining and color inside dark forest.

Since the game is top down view, you only need to design tree trunk instead of tree with leaves.

Here is sketch for next area for you.

It will be a small tricky to only use lichen or berry to decorate the scene, feel free to add the vegetation in my scene

Hope you enjoy it!
